AL ANDREAS LAZARIDIS · KARTING

PERFORMANCE METRICS

Telemetry from four dry karting sessions, April to September 2026, with the method and its limits

01 / SUMMARY

Across four dry sessions, Andreas's five best laps were within 0.2–0.7% of his best lap, and his lap time changed by only 0.3–1.2% from one lap to the next. He keeps improving inside a session: at De Landsard his best lap per stint fell by 1.0 s (1.7%) over three stints, and on a track he had never driven (Megara) he cut his lap time by 6.4% by lap 8.

TRACK CONTEXT

(1). Track Record in the 60-70Kg, until July
(2). First time in the track, driving a racing Tillotson Senior
(3). First time in the track, 1 second from the track record.

02 / LAP TIMES

LAP-TIME METRICS

SESSION	KART	CLEAN LAPS	BEST LAP	BEST 5 LAPS VS BEST	LAP-TO-LAP CHANGE	ACTUAL VS THEORETICAL BEST
Oldenzaal,NL (19/04) (1)	Rental, 4-stroke	14	40.850	+0.22%	0.54%	0.12 s (0.29%)
Megara,GR (03/05) (2)	Racing, 4-stroke	8	50.541	+0.68%	1.16%	0.12 s (0.24%)
Serres, GR (14/07) (3)	Rental, 4-stroke	8	1:11.447	+0.19%	0.32%	0.08 s (0.12%)
De Landsard, NL (04/09)	Rental, 4-stroke	25	58.635	+0.62%	0.96%	0.30 s (0.51%)

03 / CORNERS

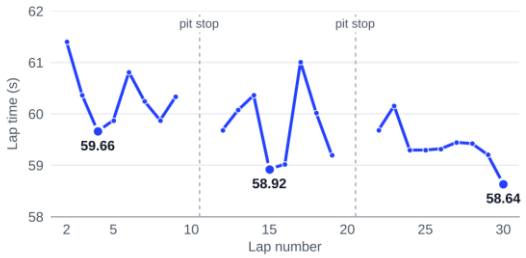

CORNER SPEEDS AND GRIP

SESSION	MAIN BRAKING CORNERS	ENTRY SPEED VARIES BY (KM/H)	SLOWEST-POINT SPEED VARIES BY (KM/H)	PEAK LATERAL G	PEAK BRAKING G	TOP SPEED (KM/H)
Oldenzaal,NL (19/04) (1)	4	±0.5	±1.0	1.37	0.32	67
Megara,GR (03/05) (2)	6	±2.8	±1.9	1.31	0.57	89
Serres, GR (14/07) (3)	6	±0.5	±0.8	1.19	0.44	75
De Landsard, NL (04/09)	4	±1.7	±1.6	1.35	0.35	75

04 / PROGRESS

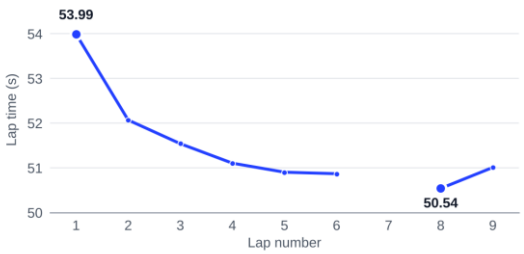

PROGRESS INSIDE A SESSION

De Landsard,

Dashed lines mark pit stops. Labels show the best lap of each stint.

Megara,

Laps 7 and 10 (56.10 s and 54.59 s) are not shown: slower than 107% of the best lap.

05 / STYLE

DRIVING STYLE: WHAT THE DATA SUGGESTS

STRONG POINTS

- **Repeatable braking and line on a familiar track.** At Oldenzaal and Serres the braking point moves by only 1.9–3.5 m from lap to lap (typical corner) and the line through the corner by about ±1.0 m.
- **Consistent pace.** The five best laps are within 0.2–0.7% of the best lap in every session.
- **Learns fast.** On the new Megara track he cut 6.4% by lap 8, and at De Landsard his stint best improved by 1.0 s.

POINTS FOR IMPROVEMENT

- **Minimum speed in the corner.** His average lap carries 2.0–5.8% less speed at the slowest point than his best lap, more than at corner entry (0.7–3.7%). Repeating the best-lap minimum speed is the biggest gain available.
- **The first laps.** The first timed lap of a run is 1.2–2.9% slower than that run's best lap (rental karts), so warm-up and the out-lap deserve a plan.
- **Braking and line on a less familiar track.** At De Landsard the typical braking point varies by 12.2 m (against 1.9–3.5 m above), and corner 4 by 13 m with a line spread of ±3.9 m (typical ±1.9 m).

Style readings are inferred from GPS-only data (no pedal, steering or kart sensors), so they describe what the kart did, not what the driver felt; Megara used a different kart and is left out of the rental comparisons.

06 / METHOD

METHOD AND LIMITS

HOW THE NUMBERS ARE CALCULATED

- **Source:** Draggy logger: about 24 position readings per second, estimated accuracy about 0.2 m.
- **Clean laps:** complete laps within 107% of the session's best lap. Out-laps, in-laps and pit stops are left out.
- **Best 5 vs best:** average of the five fastest clean laps against the best lap. Lap-to-lap change: average gap between consecutive clean laps.
- **Theoretical best:** the fastest time in each of three equal track sectors, added together. The gap shows how much one perfect lap could gain.
- **Corner speeds:** speed at the start of braking (entry) and at the slowest point; the figure is the typical lap-to-lap variation, including his progress in the session.
- **G-forces:** from GPS speed and direction; peak = 99th percentile.

LIMITS AND CONTEXT

- **Dry only.** All four sessions were dry, so there is no wet-weather data yet.
- **Different karts and tracks.** Megara used a 4-stroke racing kart, the other three rental karts. Compare percentages between sessions, not lap times or speeds.
- **Timing accuracy** is about ±0.02–0.06 s per lap; smaller differences are not meaningful.
- **Theoretical best** depends on the sector method (a second method gave 0.02–0.14 s). Read it as “under 0.5% of lap time”.
- **Small samples, no other drivers:** 8 to 25 clean laps per session. The figures show repeatability and progress, not ranking.

Disclaimer: Analysis was extracted by Claude AI based on provided Draggy exported CSV files.
